

Project Testing

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Objective

The objective of this phase is to test the implemented ACLs and verify that record access is correctly allowed or restricted based on the defined conditions.

2. Testing Activities

1. User and Role Testing

Verify that users have the correct roles and that the assigned roles provide the expected level of access.

2. Read ACL Testing

Test whether authorized users can view records and unauthorized users are restricted based on the field value.

3. Create ACL Testing

Verify that users with the required permissions can create records and unauthorized users are prevented from creating records.

4. Write ACL Testing

Test whether users can modify records when the defined conditions are satisfied and are restricted otherwise.

5. Delete ACL Testing

Verify that authorized users can delete records and unauthorized users are prevented from deleting them.

3. Test Case Summary

Operation Expected Result

Read Allow / Restrict based on condition

Create Allow / Restrict based on condition

Operation Expected Result

Write Allow / Restrict based on condition

Delete Allow / Restrict based on condition

4. Expected Outcome

All ACLs should function according to the defined access rules. Authorized operations should be permitted, while unauthorized operations should be restricted.

5. Conclusion

The Project Testing phase verifies the functionality and reliability of the implemented ACLs. Successful testing confirms that the Script-Controlled ACL correctly controls record access based on the specified conditions.
