

Project Development

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Objective

The objective of this phase is to implement the planned users, roles, tables, and scripted ACLs in the development environment.

2. Development Activities

1. Users and Roles

Create the required users and roles and assign the appropriate roles to each user.

2. Tables

Create the required table and fields, including the field that will be used for access validation. Add sample records for testing.

3. Read ACL

Create a Read ACL and configure the script to check the required field value before allowing users to view records.

4. Create ACL

Create a Create ACL to control the creation of new records based on the defined access conditions.

5. Write ACL

Create a Write ACL to control modifications to existing records according to the access rules.

6. Delete ACL

Create a Delete ACL to control the deletion of records based on the defined conditions.

3. Development Flow

Users & Roles → Tables → Read ACL → Create ACL → Write ACL → Delete ACL

Each ACL is implemented and configured according to the requirements defined in the previous phases.

4. Expected Outcome

At the end of the development phase, all required users, roles, tables, and ACLs should be implemented and ready for testing.

5. Conclusion

The Project Development phase implements the planned access-control functionality. The completed ACLs provide controlled access to records based on the defined roles, conditions, and field values.
